

METHOD AND SYSTEM FOR CACHING HTTP DATA TRANSPORTED WITH SOCKS
DATA IN IP DATAGRAMS

Abstract

The present invention is directed to computer networks and more particularly to a system and method in a network device for caching Hyper Text Transfer Protocol (HTTP) data transported in an Internet Protocol (IP) Datagram sent on a socks connection established over a Transmission Control Protocol (TCP) connection between a source port on a source device and a destination port on a destination device. The method comprises the steps of:

- identifying the source device, the destination device, the port on the source device, the port on the destination device of an incoming IP Datagram.
- determining whether the incoming IP datagram is originated by a socks client or by a socks server :

If the incoming IP Datagram is originated by a socks client:

- terminating the TCP connection and the socks connection ;
- identifying the socks connection in a table;
- identifying the application level protocol associated with the socks connection referring to this table, this table comprising for each socks connection an application level protocol;
- determining whether said application level protocol is HTTP or not:

If said application level protocol is HTTP:

- determining whether HTTP data requested by the incoming IP Datagram is in a local cache within the network device or not:
